

## PRESS RELEASE

Paris, France - January 21, 2022

### **Doctolib acquires Tanker and its end-to-end encryption technology to set a new standard for online medical confidentiality.**

**Doctolib today announced it has acquired [Tanker](#), which provides one of the most reliable ways to secure sensitive data thanks to its cutting-edge end-to-end encryption technology. By joining forces together, Doctolib is on a course to redefine what online medical confidentiality stands for.**

#### *A close partnership between Doctolib and Tanker since 2019*

Data security has always been a guiding principle for Doctolib: the important investments made, the regular third-party audits, the certifications it has been awarded and its numerous partners are a testimony to that.

That's why in 2019, Doctolib has partnered with Tanker to end-to-end encrypt data of its users, with the long-term vision to co-build the data security infrastructure of tomorrow. Tanker was founded 6 years ago with the main objective to propose cutting-edge technology ensuring a high level of privacy for sensitive data. By directly encrypting personal health information on end-user's devices, Tanker has worked with Doctolib to co-create the world's first end-to-end encryption platform built for health applications.

*"The acquisition of Tanker is the natural evolution of our relationship and we can be proud that such a technology remains in Europe, while leading global tech companies had their eyes on it."* said Stanislas Niox-Chateau, CEO and co-founder of Doctolib.

#### *A new standard for medical confidentiality*

Joining forces together will enable Doctolib to invest in Tanker's services to provide its technology on a much bigger scale and to support Doctolib's rapid growth: end-to-end encryption will continue to be implemented to all Doctolib solutions to secure personal health information, for both the 300,000 healthcare personnel users and the 60 million people using Doctolib services in France, Germany and Italy.

*"We are rolling-out end-to-end encryption on an even bigger scale," said Stanislas Niox-Chateau. "By doing so, we are able to provide an even greater level of security for all our users, without requiring any action from them. All of that thanks to a technology developed in France."*

Doctolib will accelerate the pace of innovation and aims to go beyond end-to-end encryption. Doctolib's new teams are already investing into cutting edge technologies such as secure enclaves and homomorphic encryption to create new powerful and secure features for patients and healthcare personnels. Doctolib's goal is simple: define a new standard of online medical confidentiality.

*"We deeply share the vision of Doctolib to have a positive and ethical impact on healthcare. By joining forces together, we are going to bring the Tanker technology to the next level and we will accelerate on our mission to invent the highest security standards for online medical secrecy," said Clément Ravouna, CEO and founder of Tanker.*

### ***A priority for Doctolib since its inception***

Innovation in healthcare can only happen if it relies on strong privacy measures. Alongside its investments to have the highest data security standards for its users, Doctolib is committed to ensuring that there is no gray zone on data privacy.

- **Doctolib's business model is not based on the monetization of data** or on the display of advertisements: it relies solely on a subscription paid for by health professionals and health institutions in order to use Doctolib's software solutions.
- **Doctolib users have full control over their data:** users can easily manage their security settings and Doctolib ensures that data is available to them whenever they need it.
